INSTALLATION GUIDE

NY Liquidity Model v3.2 · ATAS installation

Tools, once

1. Install the .NET SDK (not only the runtime): https://dotnet.microsoft.com/download. Which version: open `C:\Program Files\ATAS X\OFT.PlatformX.runtimeconfig.json` in Notepad; it says `"tfm": "net8.0-windows"` or `"net10.0-windows"`. Install the SDK of that major version.
2. If it says net10.0-windows, change the line `<TargetFramework>net8.0-windows</TargetFramework>` in `JadeCapNy.csproj` accordingly.
3. If ATAS X is not installed under `C:\Program Files\ATAS X`, adjust `<ATAS_BASE>` in the project file.

Build

1. Double-click `build.bat`. It compiles and copies `JadeCapNy.dll` to `%APPDATA%\ATAS X\Strategies`.
2. On an error, copy the text from the black window and send it to support.

In ATAS X

1. Chart MNQ, 5 minutes, 24-hour data. Portfolio (account) selected in the chart.
2. Right-click the chart → Strategies → add "JadeCap × Edgeful NY v3.2".
3. Check the parameters (Contracts = 1). Press the strategy's start button.
4. Open the log (ATAS → Logs): the strategy writes every decision (09:30 levels, 10:00 direction, raid, entry, bracket, exit).

Two weeks in the simulator

1. Choose the "Simulation" portfolio. Move to the live account only once the trades in the log match TradingView.

Safety

1. If the strategy stops (manually, connection loss, chart change) it closes the position (parameter "Close position when strategy stops").
2. The PC must run on weekdays 09:30–16:05 New York time (15:30–22:05 CET). Disable sleep.
3. Stop and target orders rest at the broker (CQG); if the PC fails, the stop stays active. Only break-even, time exit and the 15:55 flat need the running strategy.
